

Strategy for diffusing the next generation vehicles in Japan

1

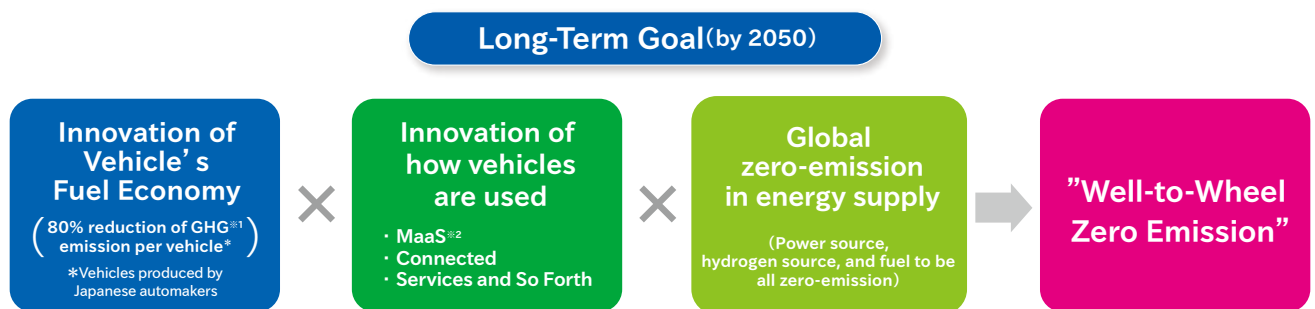

Japan Promotes Electrified Vehicle(xEV※) Strategy ahead of 2050

※xEV: HEV(Hybrid Electric Vehicle),BEV(Battery Electric Vehicle),PHEV(Plug-in Hybrid Electric Vehicle), FCEV(Fuel Cell Electric Vehicle)

Following the Paris Agreement signed at COP21 in 2015, countries and industries around the world began developing innovative solutions to tackle global climate change. Improving the environmental performance of automobiles, one of the largest global emitters, is a top priority. xEVs are one of the key technologies making fundamental changes to the automotive industry, in addition to innovations such as connected systems, autonomous driving, and car sharing services. By shifting production to focus exclusively on xEVs, the auto industry can drastically improve environmental performance and help cut global emissions.

In Japan, the market share for xEVs is approximately 30%. This strong presence demonstrates Japan's high quality in the fields of technology, industry and human resources. Globally, the market share for Japanese xEVs is approximately 30%. Leveraging its strengths, Japan aims to further promote xEVs produced by Japanese automakers to tackle global climate change around the world.

Japan sets long-term goal by the end of 2050, including: advance the shift of vehicles produced by Japanese automakers in global markets to xEVs; bring about environmental performance at the world's highest level; and contribute to realizing a "Well-to-Wheel Zero Emission" policy (to reduce emissions to zero concerning a vehicle's overall operation, from fuel and power producing process to running).

※1: GHG: Greenhouse Gas ※2: MasS: Mobility as a Service (mobility service that creates new value by connecting various transportation services)

Adoption rate of next-generation vehicles in Japan

The percentage of next-generation vehicles in new vehicles sold

Number of new vehicles sold in 2017 (actual record)	
4.386 million cars	
Conventional vehicles	63.6% (2.791 million cars)
Next-generation vehicles	36.4% (1.595 million vehicles)
Hybrid electric vehicle	31.6% (1.385 million vehicles)
Battery electric vehicle	0.41% (18,000 vehicles)
Plug-in hybrid electric vehicle	0.82% (36,000 vehicles)
Fuel cell electric vehicle	0.02% (849 vehicles)
Clean diesel vehicles	3.5% (155,000 vehicles)

2

Recent Trends in Japan

BEVs began entering the market with the introduction of Mitsubishi i-MiEV in 2009. The Nissan Leaf soon followed, currently one of the most prominent BEVs in the world, in 2010.

In 2010 when sales of Nissan Leaf first began, the driving range per charge was at 200km. After 7 years, the range doubled to 400km, after the battery capacity improved.

Performance Improvement of BEV (e.g. Nissan LEAF)

		24kWh (Launched in 2010)	30kWh (Launched in 2015)	40kWh (Launched in 2017)

Price(without tax)		Approx. 3590,000~4220,000 yen	Approx. 2890,000~4070,000 yen	Approx. 2920,000~3700,000 yen

※Specifications/price based on when commercial sales first began

A new vehicle that solves the issue with driving range per charge of BEVs and combines the best features of both BEVs and HEVs entered the market in the 2012 – the PHEV.

During short distance driving, PHEVs use the electric charge taken from an external charger in the same way BEVs do, and during long distance driving, it switches to HEV using gas. The specifications for PHEVs chosen as examples, are shown below.

The battery capacity PHEVs also seems to be on the rise as well. Driving range as a BEV is currently at approximately over 60km, meaning the vehicle can be driven purely as a BEV for daily use.

Representative Commercial PHEV

Charging time	1φ200V	Approx. 2.3 hours	Approx. 4 hours	Approx. 6 hours
	Quick (80%)	Approx. 20 minutes	Approx. 25 minutes	Approx. 30 minutes

※Specifications as of August 2018

In 2014, Toyota MIRAI was introduced to the market as the first commercial model FCEV. Honda soon followed suit with its very own CLARITY FUEL CELL, made available for leasing in 2016. Hydrogen, the fuel, is packed into 70MPa pressurized hydrogen tanks. The driving range is over 600km, only requiring 3 min. to fill the tank, making the usability comparable to that of gasoline-powered vehicles.

3 Trends in Infrastructure

3-1 Charging Infrastructure

The installation of charging stations all over the country is essential for the promotion of BEVs. Currently, there are two ways to charge the major commercial BEVs sold in Japan, normal charging (Alternate Current) and quick charging (Direct Current).

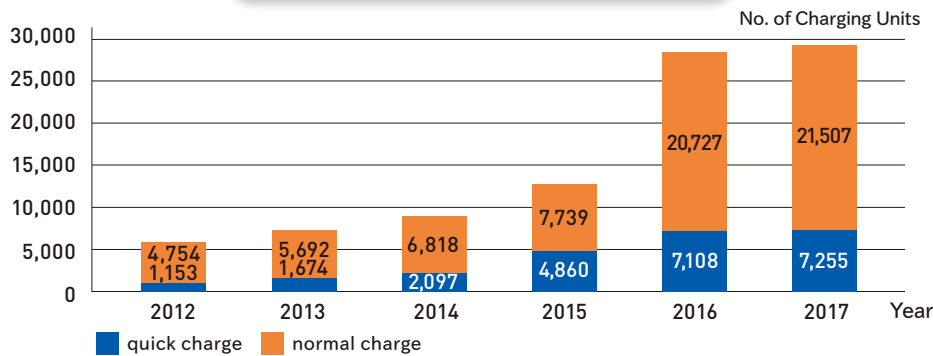

Normal charging stations can be placed in homes; the approximate charging time is 8 hours.* The cost of installation is much less compared to fast charging stations, making it more suitable for places that allow vehicles to park for a prolonged period of time e.g. homes, hotels, offices.

Electricity at a higher voltage is used for quick charging stations. 30 minutes of charging generally will result in 80% charge, making it suitable for on-the-go charging and emergencies.

The charging stations are rapidly growing in number, as the government subsidizes them.

Driving range per charge has greatly improved and at the same time, BEVs are requiring less time to charge, thus creating the stage for BEVs to be driven all over Japan. *Charging time may vary based on various conditions such as charger capacity

Installation of Charging Units

Reference: Zenrin (as of December 2017)

3-2 Hydrogen Infrastructure

Installations of hydrogen charging stations for commercial use are currently underway in the four major cities in Japan.

Since 2014, the government subsidy program, The Creation of New Demand for Fuel Cell Vehicles, by METI has been in place since 2014, which has promoted the installation of hydrogen charging stations for commercial use. There are 100 stations in operation as of August 2018.

The installation of hydrogen stations is a must in the promotion of FCEV. In the Basic Strategy of Hydrogen, a government paper, the target number of stations is as follows: 160 stations by fiscal year 2020, 320 by fiscal year 2025. In addition, the target numbers for FCEVs are: approximately 40,000 vehicles by 2020, and approximately, 200,000 vehicles by 2025, reaching approximately 800,000 vehicles by 2030.

100 Stations in major cities and surrounding areas

Number of Hydrogen Stations installed

Kanto region : 40 stations

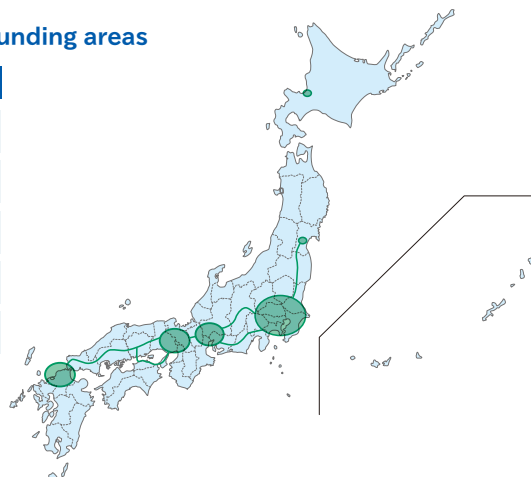

Chukyo region : 25 stations

Kansai region : 12 stations

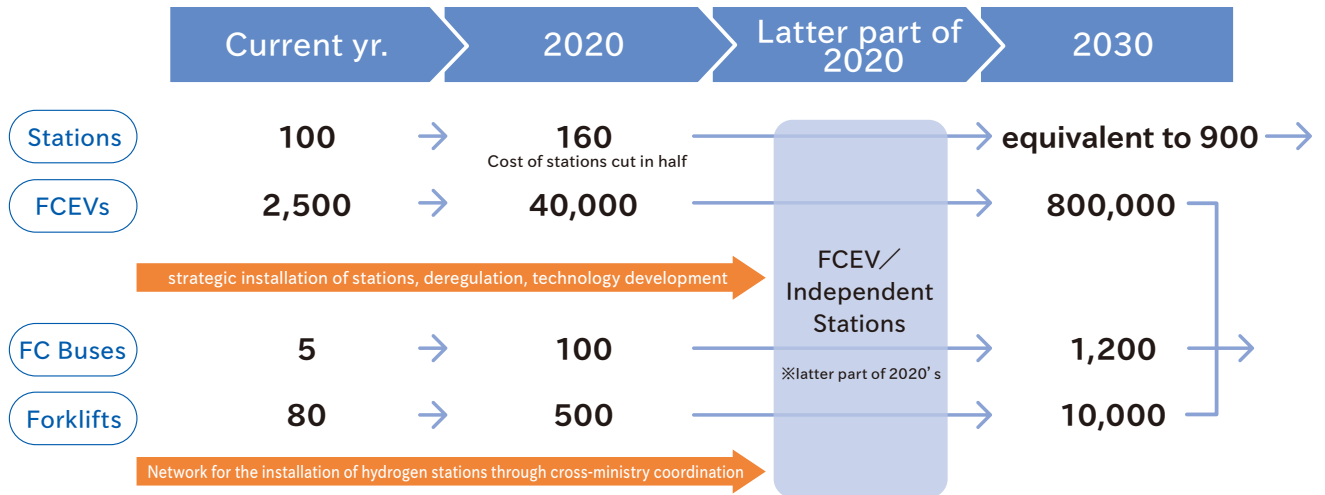

Northern Kyushu region : 11 stations

Other regions : 12 stations

* as of August 2018
Areas where stations will be installed as a part of the government subsidy program for the Creation of New Demand for Fuel Cell Vehicles

Adoption scenario for FCEV and other vehicles etc.

4

New role as a mobile power source

Considerations are currently underway to utilize BEVs, PHEVs and FCEVs as part of the power supply grid. Unlike vehicles of the past, BEVs and PHEVs have large capacity batteries that can electrically connect to the power supply for a prolonged amount of time. The aim is to use this capability as a power supply system. Shown below is what roles electric vehicles should take as part of the power supply grid.

Roles of EVs as part of the power supply

Name	Flow of Electricity	Expected features
Vehicle to Home (V2H)	From EV to home	Use of electricity of the vehicle as emergency power supply for the home
Vehicle to Grid* (V2G)	From EV to the grid	Supply electricity from vehicle to the power supply grid to use for adjusting the frequencies/demands to the power supply

※uses power distribution networks owned by electric companies

V2Hs were commercialized at the time of the Great Eastern Japan Earthquake. In many instances, they are used in combination with BEVs at time of purchase.

The usage of V2Gs will grow in the future, connecting a large number of BEVs and PHEVs to the power supply grid. Field-testing for utilizing them as controllable frequency or as power source to adjust energy demands is currently underway.

◀ Overview of CEV Subsidy* ▶

*CEV: Clean Energy Vehicle

Subsidy To Promote CEV Purchase

Government will use public funds to subsidize part of the cost to purchase clean energy cars such as BEVs, PHEVs, and FCEVs

How to calculate subsidy

The amount of subsidy is calculated based on the grade of the clean energy vehicle. The subsidy is paid within the limits set per vehicle grade and subsidy will not be paid to vehicles if the calculated amount is under 15,000 yen.

Subsidy is given at a standard rate (per 1,000 yen) for each vehicle model/grade.

1 Battery Electric Vehicles(BEV)

Subsidy is calculated based on the driving range per charge.

$$\text{subsidy amount} = \left(\text{subsidy per driving range per charge (1,000 yen/km)} \times \text{driving range per charge} \right) \times \text{subsidy rate } \frac{1}{1}$$

※subsidy rate 1/1 means 100% subsidy

2 Plug-in Hybrid Electric Vehicles(PHEV)

Subsidy amount is 200,000 yen for all vehicles. (limited to EVs with calculated driving range over 30km)

3 Fuel Cell Energy Vehicles(FCEV) · Clean Diesel Vehicles(CDV)

Subsidy amount is calculated based on the price (MSRP) difference between the clean energy vehicle and the gasoline-powered vehicles of the same model/grade.

Subsidy amount (= vehicle price - standard price) x subsidy rate

$$\text{subsidy amount} = \left(\text{A Vehicle Price} - \text{B Standard Amount} \right) \times \text{C Subsidy Rate}$$

A.Vehicle Price MSRP (retail price) excluding consumption tax

B.Standard Amount

- Price of the gasoline-powered vehicles (base model) of the same model/grade clean energy vehicle
- For clean diesel vehicles, the reduction in the estimated running cost such as the cost of fuel over a certain number of years is added

C.Subsidy Rate Subsidy Rate is the rate in which subsidy is provided. The rates for the various grades of clean energy vehicles are shown below.
 ▶ FCEV(2/3) ▶ CDV(1/12)

Max. amount per clean energy vehicle type

Clean energy vehicle types	Max. amount of subsidy	Clean energy vehicle types	Max. amount of subsidy
BEV (Battery Electric Vehicles)	400,000 yen	FCEV (Fuel Cell Energy Vehicle)	Unlimited
PHEV (Plug-in Hybrid Vehicles)	200,000 yen	CDV (Clean Diesel Vehicle)	150,000 yen

Company Profile

Name Next Generation Vehicle Promotion Center : NeV

Location Nihonbashi Kimura Building,1-16-3 Nihonbashi, Chuo-ku, Tokyo, 103-0027, Japan

History Established February 19, 2007.
Separate from the Japan Automobile Research Institute; named the Electric Vehicle Promotion Center.
Changed name April 1, 2009.
Obtained corporate status as a general incorporated association and changed name to what it is today.

Objective Contribute to the implementation of Japan's energy and environmental policies by promoting vehicles with superior energy and environmental performance.

Abbreviation

Abbreviations used in this pamphlet will be as follows.
Excludes proper nouns.

BEV	Battery Electric Vehicle
HEV	Hybrid Electric Vehicle
PHEV	Plug-in Hybrid Electric Vehicle
FCEV	Fuel Cell Electric Vehicle
